

A Lightweight PDF Ferry for Research Agents

Alice Example and Bob Researcher

Abstract

We present a browser-to-agent pipeline that extracts complete PDF text and preserves source metadata. The pipeline reports integrity limitations explicitly instead of silently losing unavailable content.

1 Introduction

Research papers opened in a browser often use a built-in PDF viewer rather than a normal HTML document. A dedicated extractor must fetch the original bytes, validate the source, and preserve all available text. The extracted Markdown continues through the existing chunked handoff protocol without silent truncation. Clear errors distinguish download failures, encrypted files, damaged files, and documents without text. This fixture includes enough prose to exercise completeness thresholds and section recognition reliably.

2 Method

A dedicated extractor must fetch the original bytes, validate the source, and preserve all available text.
The extracted Markdown continues through the existing chunked handoff protocol without silent truncation.
Clear errors distinguish download failures, encrypted files, damaged files, and documents without text.
This fixture includes enough prose to exercise completeness thresholds and section recognition reliably.
A dedicated extractor must fetch the original bytes, validate the source, and preserve all available text.
The extracted Markdown continues through the existing chunked handoff protocol without silent truncation.
Clear errors distinguish download failures, encrypted files, damaged files, and documents without text.
This fixture includes enough prose to exercise completeness thresholds and section recognition reliably.
A dedicated extractor must fetch the original bytes, validate the source, and preserve all available text.
The extracted Markdown continues through the existing chunked handoff protocol without silent truncation.
Clear errors distinguish download failures, encrypted files, damaged files, and documents without text.
This fixture includes enough prose to exercise completeness thresholds and section recognition reliably.
